

**Instructions: You have a total of 50 minutes to complete this test. Answer each of the following questions completely providing details and correct SI units.**

Time Start \_\_\_\_\_ Time finish \_\_\_\_\_ pledged \_\_\_\_\_

**Constants:**  $R=8.314 \text{ J/(K mol)}$ ; water:  $c=4186 \text{ J/(}^\circ\text{C kg)}$ ,  $L_f=3.33 \times 10^5 \text{ J/kg}$

**[1] An ideal 3 dimensional diatomic gas with rotational modes realized but not vibrational modes** has the equation of state  $PV=nRT$  where  $n$  is the number of moles. **You may assume  $n=2$  moles for this entire problem.**

**(a)** Calculate  $c_v$ ,  $c_p$  and the adiabatic coefficient  $\gamma$  for this gas, providing numerical answers with correct SI units.

$c_v=$  \_\_\_\_\_  $c_p=$  \_\_\_\_\_  $\gamma=$  \_\_\_\_\_

**(b)** Suppose that the ideal gas in (a) had an initial volume of  $V_i=1 \text{ m}^3$  and went through an **isothermal process ( $T=T_i=300 \text{ K}$ )** which resulted in  $V_f=2 \text{ m}^3$ . **Providing correct SI units, calculate the following:**

$P_i=$  \_\_\_\_\_  $Q=$  \_\_\_\_\_  $W=$  \_\_\_\_\_  $\Delta U=$  \_\_\_\_\_

**(c)** Suppose that the same gas went through an **isovolumeric ( $V=V_i$ )** process which resulted in  $T_f=600 \text{ K}$  where  $T_i=200 \text{ K}$  with  $P$  changing from  $P_i$  to  $P_f$ . **Providing correct SI units, calculate the following:**

$\Delta U=$  \_\_\_\_\_  $W=$  \_\_\_\_\_  $Q=$  \_\_\_\_\_

**[2]** An unknown solid material is observed to have a length of  $L_0=1$  m at  $0^\circ\text{C}$  and a length of  $L=1.5$  m at  $100^\circ\text{C}$ . **In your answers, be sure to use correct SI units.**

**(a)** Calculate the coefficient of linear expansion for this material.

$$\alpha = \underline{\hspace{2cm}}$$

**(b)** A different material (**not the same material as in part a**) has a coefficient of volume expansion given by  $\gamma=5.0 \times 10^{-2}/\text{C}$ . Suppose a cube of this material with a volume  $V_0=1$  m<sup>3</sup> is heated from  $0^\circ\text{C}$  to  $100^\circ\text{C}$ , calculate the work done when it expands against a constant pressure of  $P=1 \times 10^5$  Pa.

$$W = \underline{\hspace{2cm}}$$

**(c)** Suppose the material in (b) above has a mass of 500 kg and a specific heat at a constant pressure of  $c_p=20$  J/(kg  $^\circ\text{C}$ ). Calculate the heat supplied to the system.

$$Q = \underline{\hspace{2cm}}$$

**(d)** Calculate  $\Delta U$  when the material in (b) above is expanded (as in b) and simultaneously heated (as in c).

$$\Delta U = \underline{\hspace{2cm}}$$

**[3]** A heat engine produces 80 Joules of work for a heat input of 200 J.

**(a)** Calculate the efficiency of this engine.

$$\varepsilon = \underline{\hspace{2cm}}$$

**(b)** How much heat does this engine reject?

$$Q_c = \underline{\hspace{2cm}}$$

**(c)** Suppose this engine operates with a lower temperature of  $T_c = 100^\circ\text{C}$ . If the engine has an efficiency equal to the Carnot efficiency, what is the temperature of the hotter reservoir?

$$T_H = \underline{\hspace{2cm}}$$

**[4](a)** If 1 kg of water at  $0^{\circ}\text{C}$  is mixed with 1 kg of water at  $75^{\circ}\text{C}$ , calculate the final equilibrium temperature of the mixture.

$$T_f = \underline{\hspace{2cm}}$$

**[4](b)** Calculate the change in entropy of the water as a result of the mixing described in part a, be sure to provide correct SI units.

$$\Delta S = \underline{\hspace{2cm}}$$

**[4](c)** If a 3 kg mass of ice at  $0^{\circ}\text{C}$  melts to become water at  $0^{\circ}\text{C}$ , calculate the change in entropy of the ice.

$$\Delta S = \underline{\hspace{2cm}}$$
